

Project settings

If you have created your own project, or are an administrator of a project, you can change project settings.

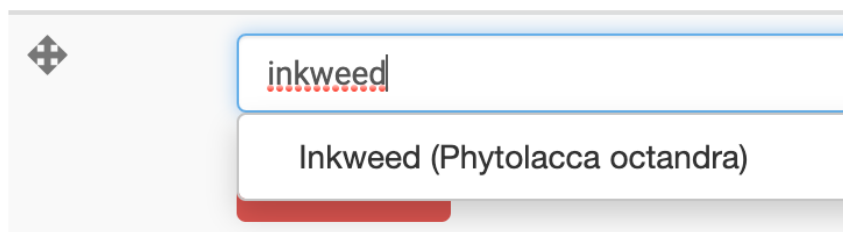

1. Go to **My Projects** and click on the name of your project.
2. Click **Settings** in the project menu.
3. The **About**, **Location**, and **Sharing** tabs allow you to edit the information you entered when creating the project.
4. The **Species** and **Herbicides** tabs are described below.

Using the Species tab

WeedManager is preloaded with a list of weed species. You can customise this to make a shortlist for quick and easy access when adding weeds via the website or the app.

1. Click the **Species** tab to select weed species you are managing for this project.
 - Weed species not listed here can still be managed, but selected species will be shortlisted to appear at the top of the lists.
2. To add a weed to the shortlist, start typing its name (either common or scientific). Matching weeds will appear in the dropdown.
3. Select the weed and click **Add another weed species** to add additional species, or click **Save** to finish.
 - If a weed does not match the preloaded list, double check the spelling.

Project weed species

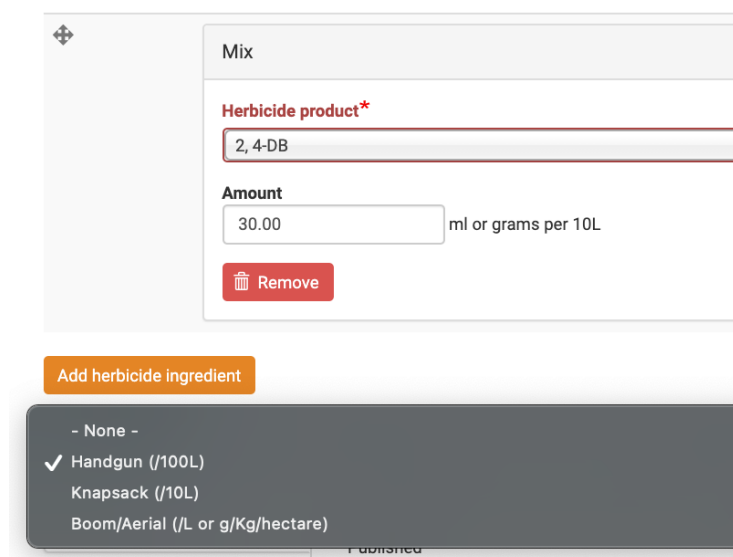

The interface shows a search bar with the text "inkweed" and a dropdown menu displaying "Inkweed (Phytolacca octandra)". To the left of the search bar is a small icon of a crosshair.

Add another weed species

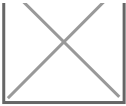

Using the Herbicides tab

WeedManager is preloaded with a list of herbicides and allows you to create customised herbicide mixes.

1. Click the green **+ Add new mix** button.
2. Give your mix a helpful **Name** (eg. "Blackberry TBXT") and optionally a more detailed **Description**.
3. Under **Mix** you can create a custom mixture.
 - Select the first Herbicide product you want to include in your mixture
 - Choose the **Amount** per 10 litres (in ml or g)
 - Click **Add herbicide ingredient** and repeat for the remaining ingredients.
 - Choose an **Application Method**
4. When your new mixture is complete click **Save** to finish.

The interface shows a form for creating a herbicide mix. It includes a "Mix" section with a "Herbicide product*" dropdown menu (showing "2, 4-DB") and an "Amount" input field (showing "30.00") with a unit selector "ml or grams per 10L". Below these is a "Remove" button. At the bottom, there is an "Add herbicide ingredient" button and a list of application methods: "- None -", "✓ Handgun (/100L)", "Knapsack (/10L)", and "Boom/Aerial (/L or g/Kg/hectare)".

As an example, you should see something like this after creating a mix or two

Herbicide mix *Woody weeds by boom* has been created. ✕
